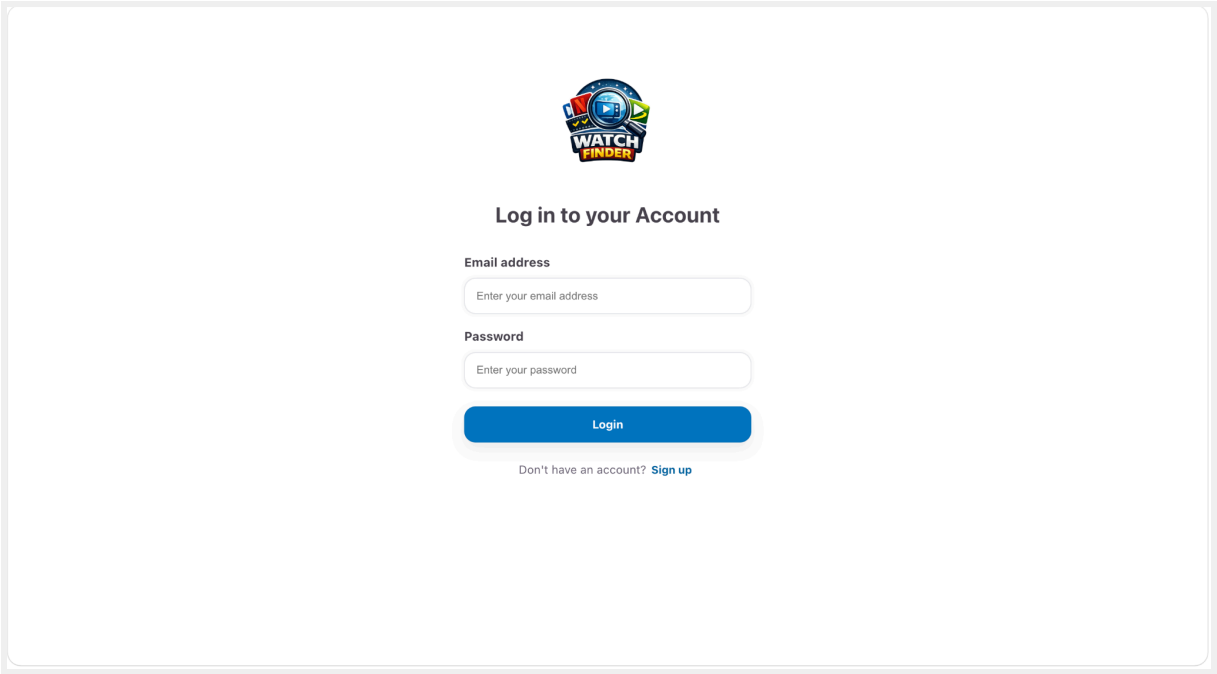
Web Interface Functionalities/User Guide

Logging In & Account Creation

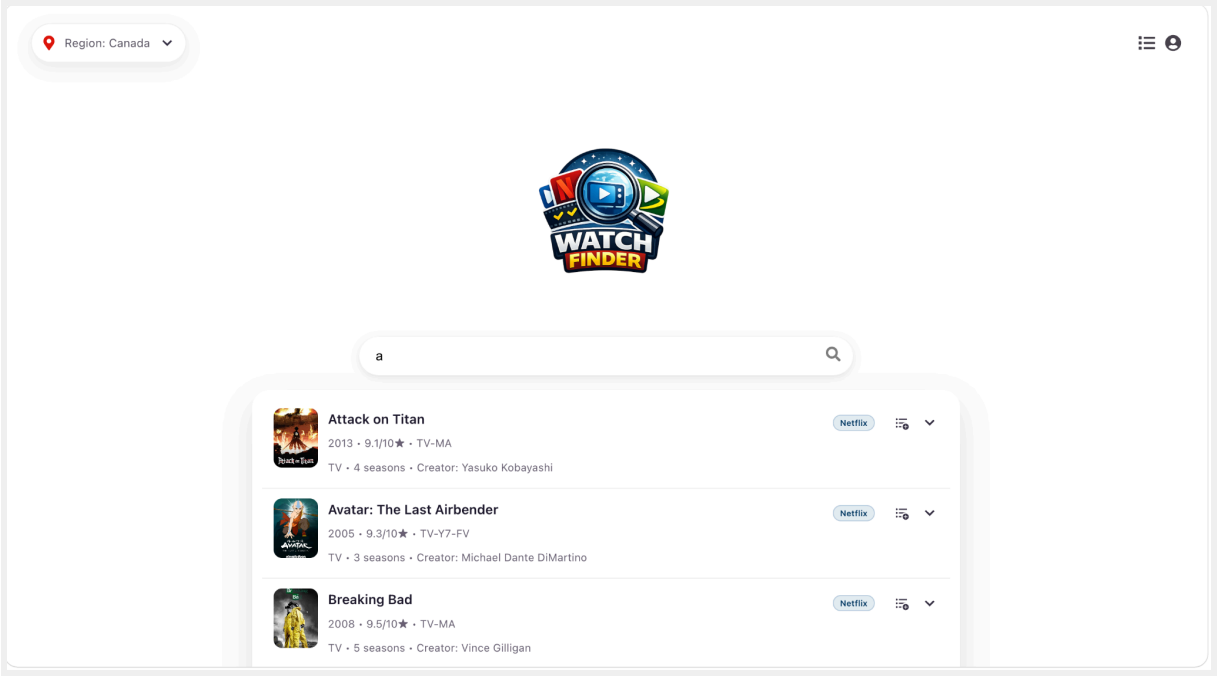


After getting both the backend and frontend servers running (refer to README.md for details regarding project setup), accessing the link from the frontend server (e.g. http://localhost:5173 typically), the login screen should be displayed first. From here either login using existing credentials in the database (refer to below for example data from the database setup script), or sign up by clicking the link at the bottom to make a new account.

Email/Password for test users (included from using db_setup.sql file):

- Ada: ada.lovelace@ucalgary.ca password12
- Alice: alice@email.com insecure_password
- Jane: jane.doe@ucalgary.ca password
- John (admin user): john2@email.com unhashed_plaintext_password

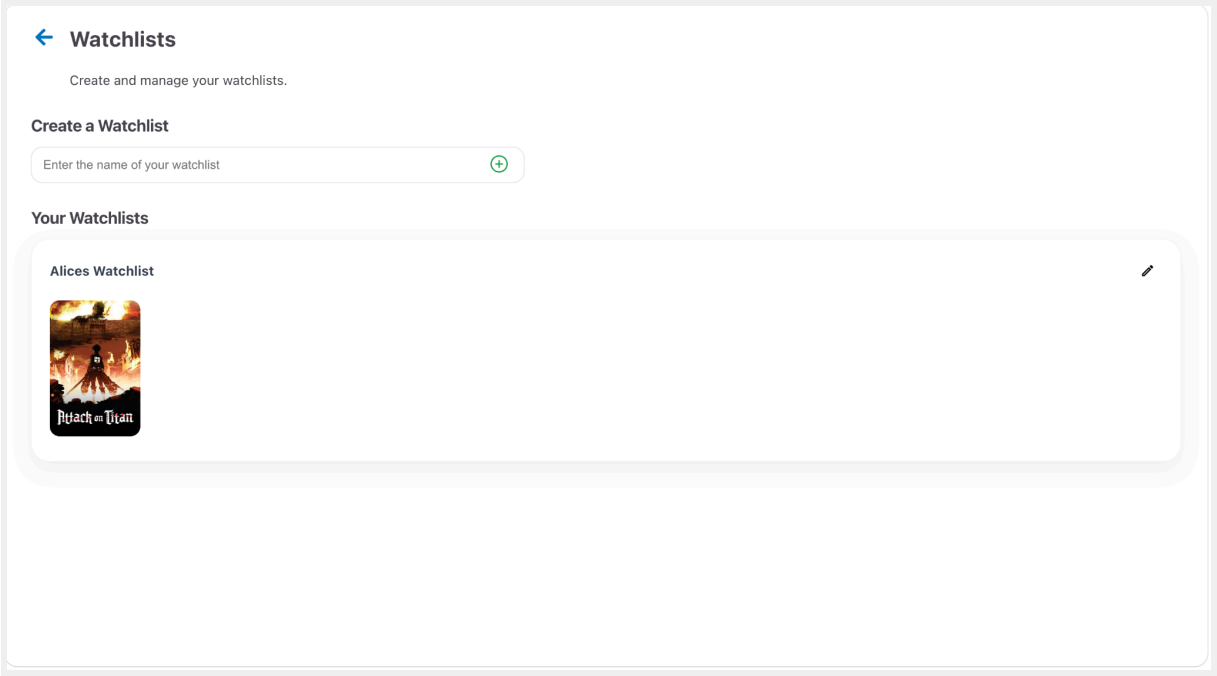
Searching for Media



Use the search bar on the homepage to find movies or TV shows available in the current region. Results appear dynamically in a dropdown list. The region dropdown menu in the top-left corner allows for changing which region to search shows for.

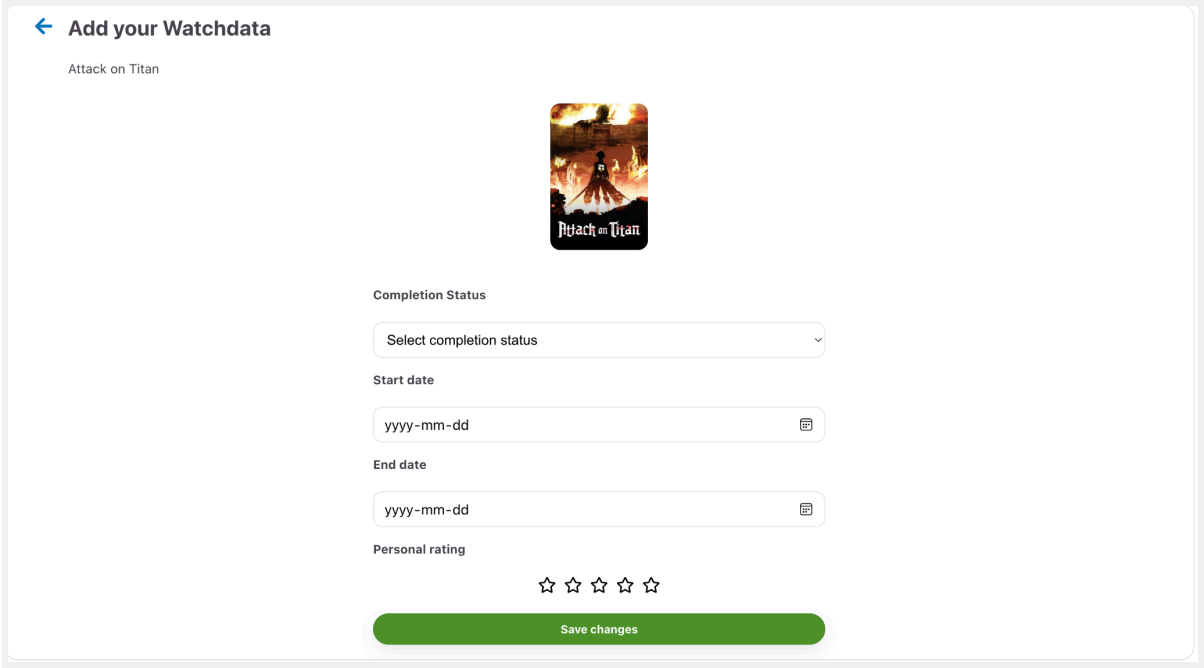
Details for media titles can be viewed in the list results, as well as allowing for quick access to streaming services that offer it. Additional details can be viewed, and the list '+' button the right side allows for adding the media title to a watchlist (if one exists, more details later)

Watchlists



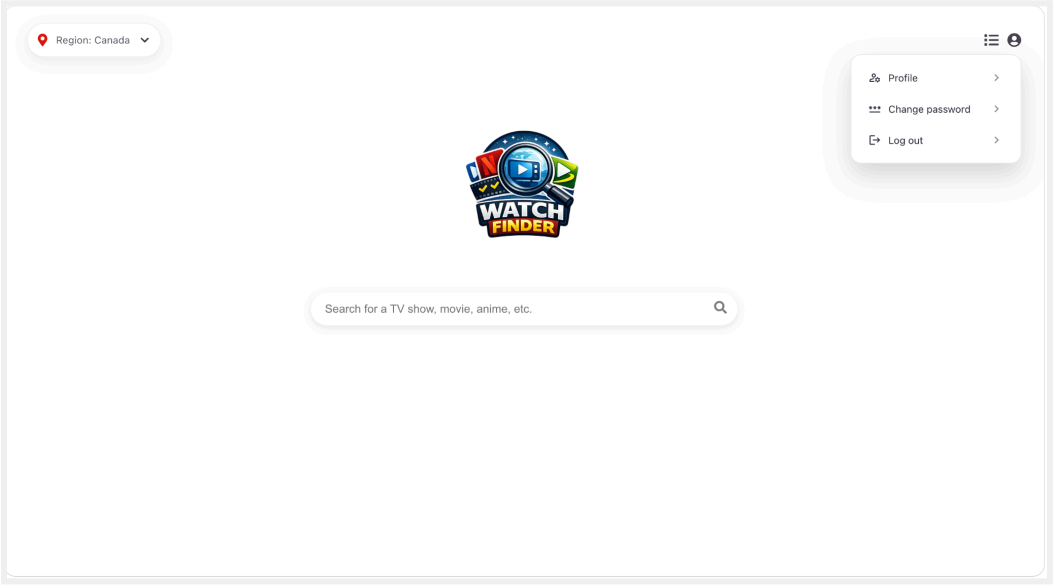
The watchlist icon in the top-right corner of the homepage provides access to all saved watchlists. Users can view, edit, and manage their watchlists. After creating a watchlist, media titles can be added from the homepage to the watchlist.

Watchdata



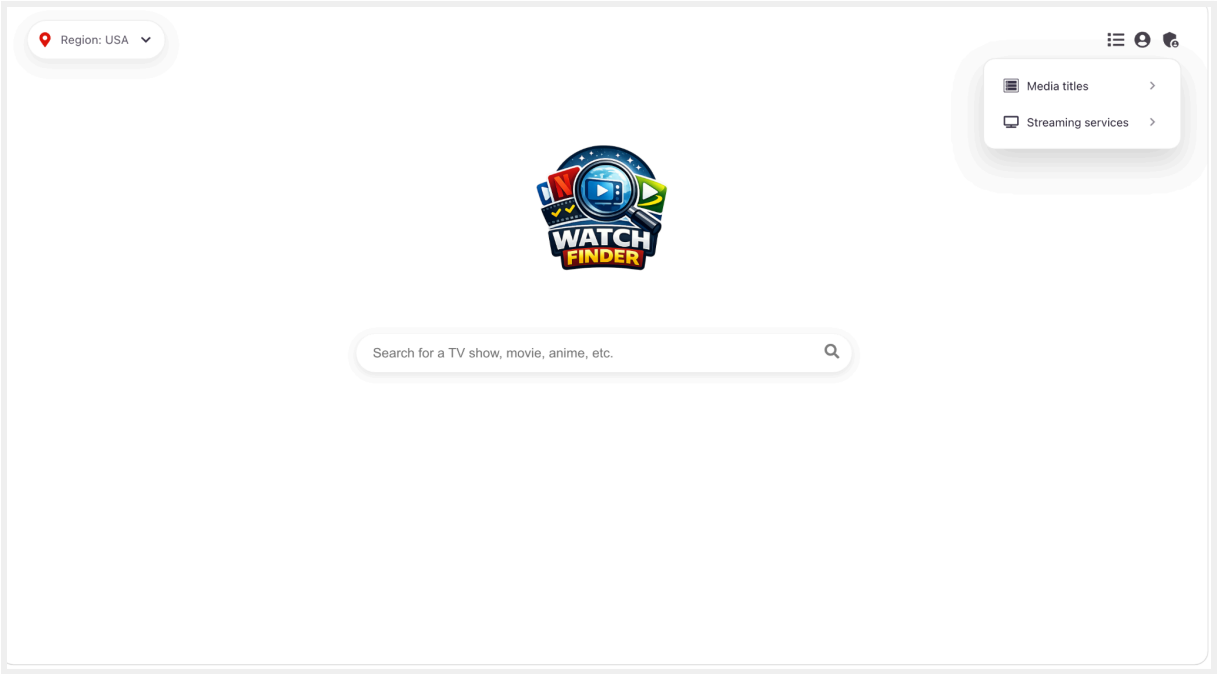
Within a watchlist, users can view detailed watch data for each title. To access it, click on a media title in a watchlist to open its watchdata page.

Account Settings Menu



The profile icon in the top-right corner opens a dropdown menu containing account management options such as profile, change password and logging out.

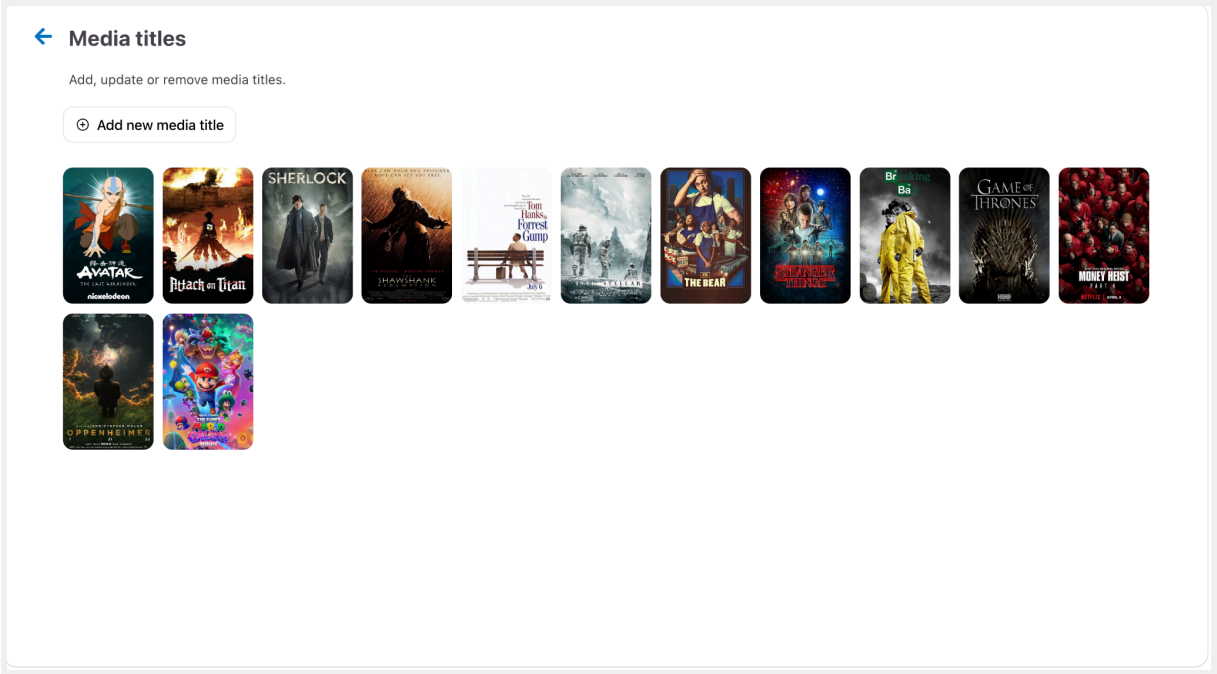
Administrator Access

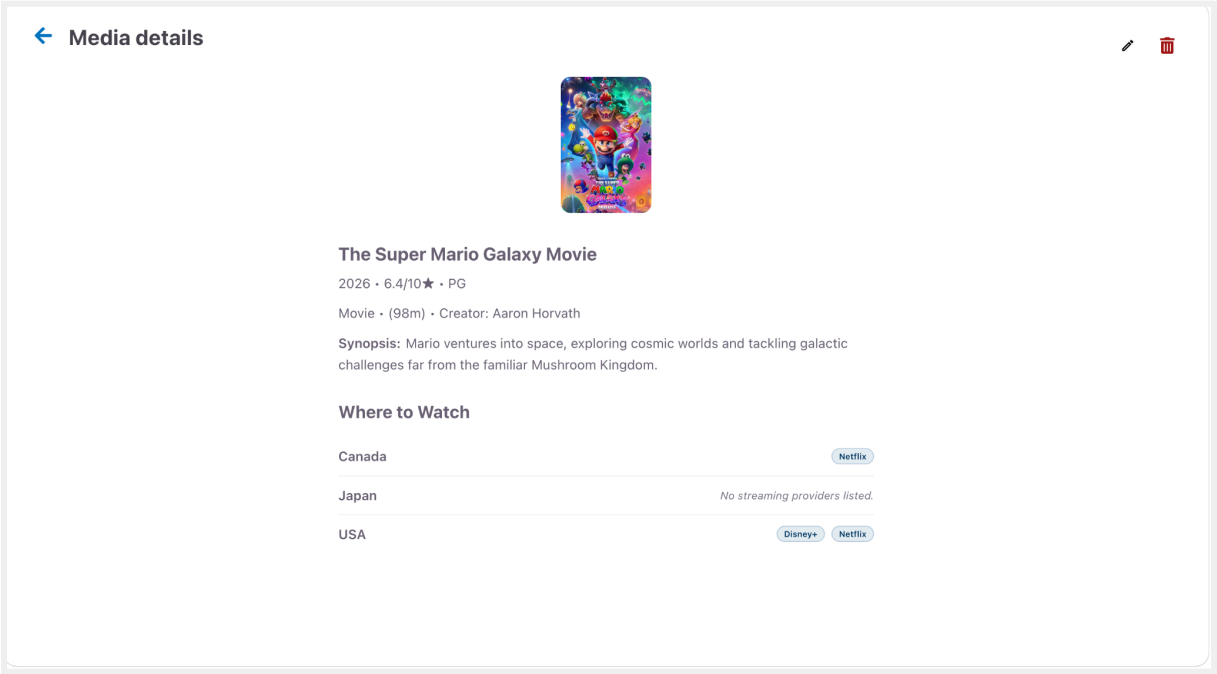


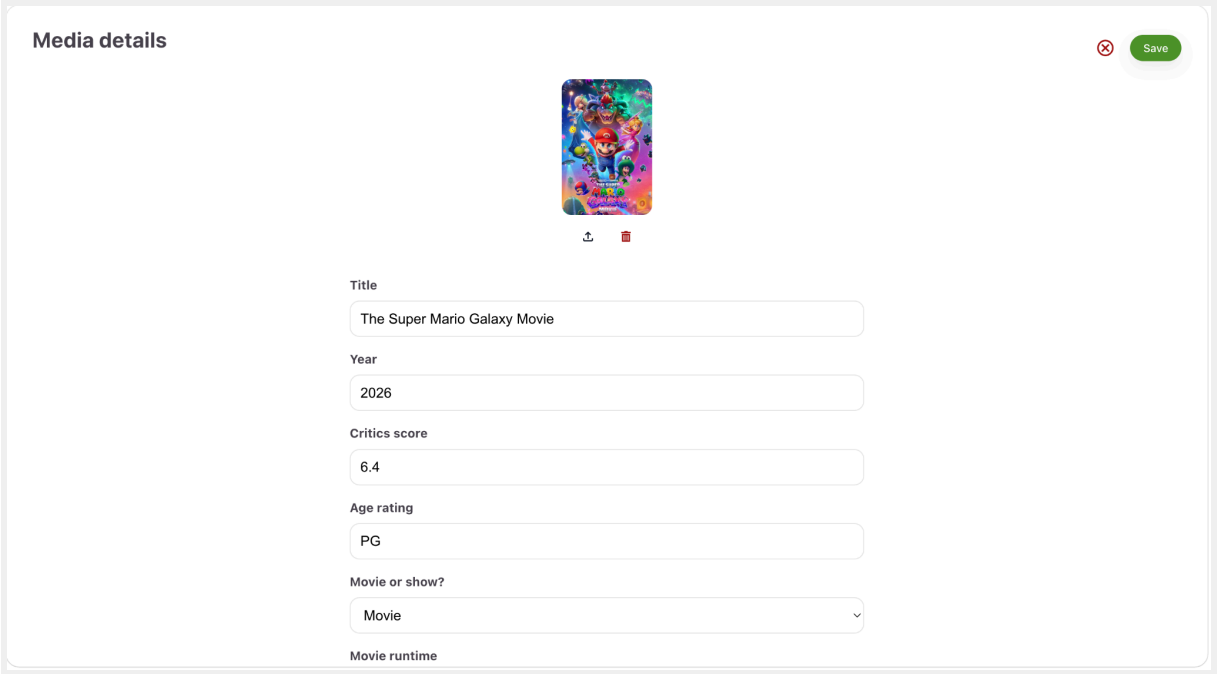
Administrator accounts are created directly in the database and are not available through the application interface. In the example data, the account with email “john2@email.com” and password “unhashed_plaintext_password” has administrative privileges. Logging out of a normal user account and logging in with this admin account will allow access to additional functionalities.

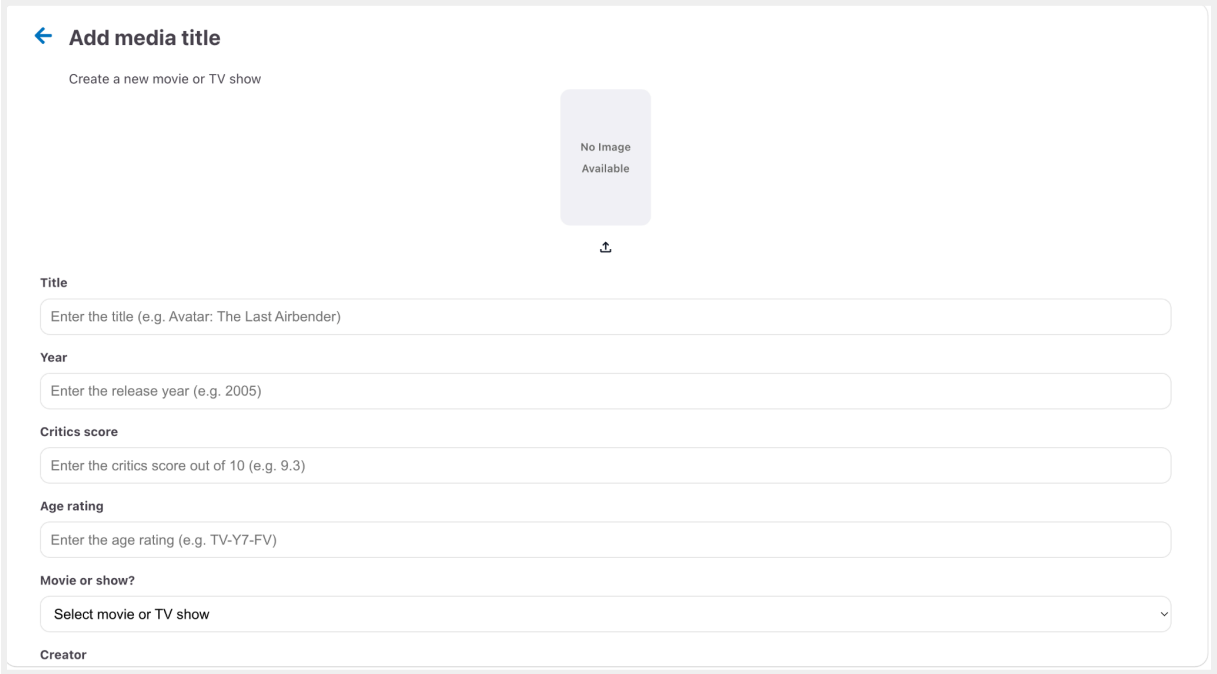
Administrator privileges provide access to manage media titles, streaming services and regional availability via a shield icon in the top-right corner.

Media Title Management



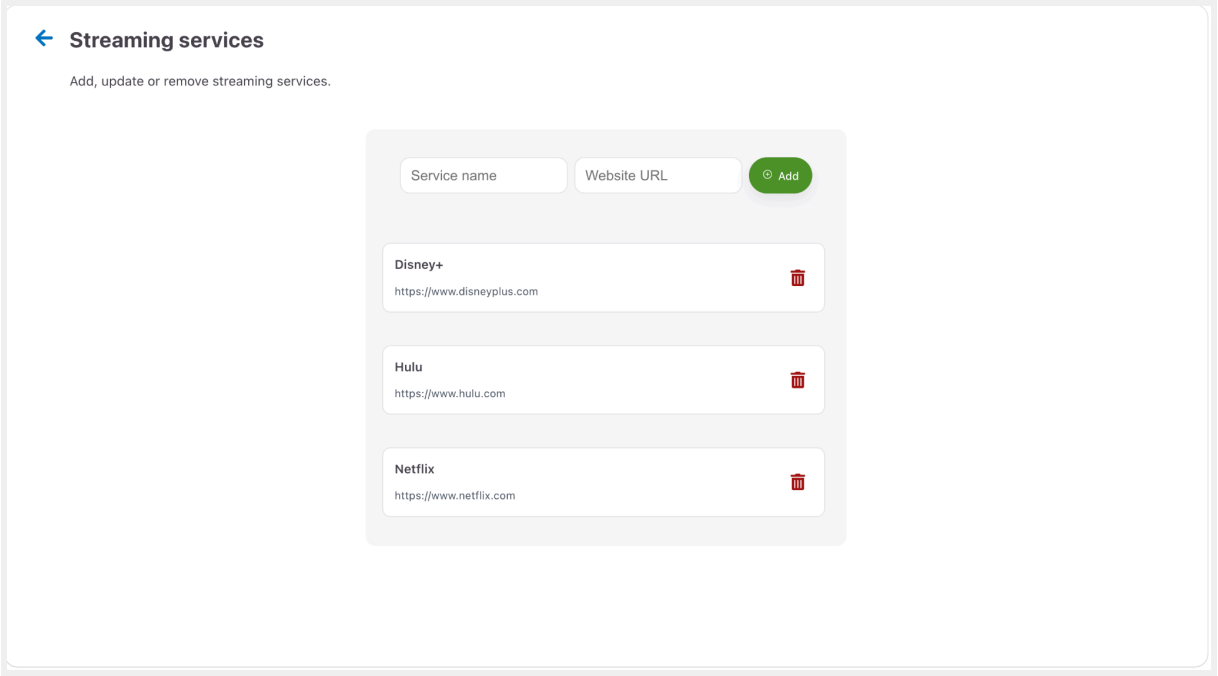






The shield icon in the top-right corner provides access to media title management. Administrators can view detailed information for each media title, update existing entries, add new media titles, or delete media titles as needed. Streaming services, including their associated website URLs and regional availability, can also be added or removed to ensure accurate access for users.

Streaming Service Management



Within the same shield icon, administrators can manage streaming services. This includes adding new streaming services or deleting services that are no longer available.
